Beginner’s essential

JavaScript Cheat Sheet

The Language of the Web.
# TABLE OF CONTENTS

- JavaScript Basics                           3
- Variables in JavaScript                     3
- The Next Level: Arrays                     4
- Operators                                   5
- Functions                                   6
- JavaScript Loop                             7
- If - Else Statements                        8
- Strings                                     8
- Regular Expression Syntax                   9
- Numbers and Math                           11
- Dealing with Dates in JavaScript            13
- DOM Mode                                   14
- Working with the User Browser              17
- JavaScript Events                          19
Including JavaScript in an HTML Page

```html
<script type="text/javascript">

//JS code goes here

</script>
```

Call an External JavaScript File

```html
<script src="myscript.js"></script>
```

Including Comments

- Single line comments - //</code>
- Multi-line comments - /* comment here */

VARIABLES IN JAVASCRIPT

**var, const, let**

**var** — The most common variable. Can be reassigned but only accessed within a function. Variables defined with var move to the top when code is executed.

**const** — Can not be reassigned and not accessible before they appear within the code.

**let** — Similar to const, however, let variable can be reassigned but not re-declared.

Data Types

**Numbers** — `var age = 23`

**Variables** — `var x`

**Text (strings)** — `var a = "init"`

**Operations** — `var b = 1 + 2 + 3`
True or false statements — `var c = true`

Constant numbers — `const PI = 3.14`

Objects — `var name = {firstName:"John", lastName:"Doe"}`

Objects

```javascript
var person = {
    firstName:"John",
    lastName:"Doe",
    age:20,
    nationality:"German"
};
```

THE NEXT LEVEL: ARRAYS

```javascript
var fruit = ["Banana", "Apple", "Pear"];```

Array Methods

```javascript
concat() — Join several arrays into one
indexOf() — Returns the primitive value of the specified object
join() — Combine elements of an array into a single string and return the string
lastIndexOf() — Gives the last position at which a given element appears in an array
pop() — Removes the last element of an array
push() — Add a new element at the end
reverse() — Sort elements in descending order
shift() — Remove the first element of an array
slice() — Pulls a copy of a portion of an array into a new array```
sort() — Sorts elements alphabetically
splice() — Adds elements in a specified way and position
toString() — Converts elements to strings
unshift() — Adds a new element to the beginning
valueOf() — Returns the first position at which a given element appears in an array

OPERATORS

Basic Operators

+ — Addition
- — Subtraction
* — Multiplication
/ — Division

(...) — Grouping operator, operations within brackets are executed earlier than those outside

% — Modulus (remainder)

++ — Increment numbers
-- — Decrement numbers

Comparison Operators

== — Equal to
=== — Equal value and equal type
!= — Not equal
!== — Not equal value or not equal type
>
>= — Greater than
< — Less than
>— Greater than or equal to
Logical Operators

&& — Logical and

|| — Logical or

! — Logical not

Bitwise Operators

& — AND statement

| — OR statement

~ — NOT

^ — XOR

<< — Left shift

>> — Right shift

>>> — Zero fill right shift

FUNCTIONS

function name(parameter1, parameter2, parameter3) {
    // what the function does
}

Outputting Data

alert() — Output data in an alert box in the browser window

confirm() — Opens up a yes/no dialog and returns true/false depending on user click

crash.console.log() — Writes information to the browser console, good for debugging purposes
document.write() - Write directly to the HTML document
prompt() - Creates an dialogue for user input

Global Functions

decodeURI() - Decodes a Uniform Resource Identifier (URI) created by encodeURI or similar

decodeURIComponent() - Decodes a URI component

encodeURI() - Encodes a URI into UTF-8

codeURIComponent() - Same but for URI components

eval() - Evaluates JavaScript code represented as a string

isFinite() - Determines whether a passed value is a finite number

isNaN() - Determines whether a value is NaN or not

Number() - Returns a number converted from its argument

parseFloat() - Parses an argument and returns a floating point number

parseInt() - Parses its argument and returns an integer

JAVASCRIPT LOOPS

for (before loop; condition for loop; execute after loop) {
  // what to do during the loop
}

for - The most common way to create a loop in JavaScript

while - Sets up conditions under which a loop executes

do while - Similar to the while loop, however, it executes at least once and performs a check at the end to see if the condition is met to execute again

break - Used to stop and exit the cycle at certain conditions

continue - Skip parts of the cycle if certain conditions are met
IF - ELSE STATEMENTS

```javascript
if (condition) {
    // what to do if condition is met
} else {
    // what to do if condition is not met
}
```

STRINGS

```javascript
var person = "John Doe";
```

Escape Characters

```
\' — Single quote
\" — Double quote
\\ — Backslash
\b — Backspace
\f — Form feed
\n — New line
\r — Carriage return
\t — Horizontal tabulator
\v — Vertical tabulator
```

String Methods

- `charAt()` — Returns a character at a specified position inside a string
- `charCodeAt()` — Gives you the unicode of character at that position
- `concat()` — Concatenates (joins) two or more strings into one
fromCharCode() — Returns a string created from the specified sequence of UTF-16 code units

indexOf() — Provides the position of the first occurrence of a specified text within a string

lastIndexOf() — Same as indexOf() but with the last occurrence, searching backwards

match() — Retrieves the matches of a string against a search pattern

replace() — Find and replace specified text in a string

search() — Executes a search for a matching text and returns its position

slice() — Extracts a section of a string and returns it as a new string

split() — Splits a string object into an array of strings at a specified position

substr() — Similar to slice() but extracts a substring depended on a specified number of characters

substring() — Also similar to slice() but can’t accept negative indices

toLowerCase() — Convert strings to lower case

toUpperCase() — Convert strings to upper case

valueOf() — Returns the primitive value (that has no properties or methods) of a string object

REGULAR EXPRESSION SYNTAX

Pattern Modifiers

e — Evaluate replacement

i — Perform case-insensitive matching

g — Perform global matching

m — Perform multiple line matching

s — Treat strings as single line
x — Allow comments and whitespace in pattern
U — Ungreedy pattern

**Brackets**

[abc] — Find any of the characters between the brackets
[^abc] — Find any character not in the brackets
[0-9] — Used to find any digit from 0 to 9
[A-z] — Find any character from uppercase A to lowercase z
(a|b|c) — Find any of the alternatives separated with |

**Metacharacters**

. — Find a single character, except newline or line terminator
\w — Word character
\W — Non-word character
\d — A digit
\D — A non-digit character
\s — Whitespace character
\S — Non-whitespace character
\b — Find a match at the beginning/end of a word
\B — A match not at the beginning/end of a word
\0 — NUL character
\n — A new line character
\f — Form feed character
\r — Carriage return character
\t — Tab character
\v — Vertical tab character
\xxx — The character specified by an octal number xxx
\xDD — Character specified by a hexadecimal number \dd
\Uxxxx — The Unicode character specified by a hexadecimal number \xxxx

Quantifiers

n+ — Matches any string that contains at least one n

n* — Any string that contains zero or more occurrences of n

n? — A string that contains zero or one occurrences of n

n{X} — String that contains a sequence of X n’s

n{X,Y} — Strings that contains a sequence of X to Y n’s

n{X,} — Matches any string that contains a sequence of at least X n’s

n$ — Any string with n at the end of it

^n — String with n at the beginning of it

?=n — Any string that is followed by a specific string n

?!n — String that is not followed by a specific string n

NUMBERS AND MATH

Number Properties

MAX_VALUE — The maximum numeric value representable in JavaScript

MIN_VALUE — Smallest positive numeric value representable in JavaScript

NaN — The “Not-a-Number” value

NEGATIVE_INFINITY — The negative Infinity value

POSITIVE_INFINITY — Positive Infinity value

Number Methods

toExponential() — Returns a string with a rounded number written as exponential notation
toFixed() — Returns the string of a number with a specified number of decimals

toPrecision() — String of a number written with a specified length

toString() — Returns a number as a string

valueOf() — Returns a number as a number

Math Properties

E — Euler’s number

LN2 — The natural logarithm of 2

LN10 — Natural logarithm of 10

LOG2E — Base 2 logarithm of E

LOG10E — Base 10 logarithm of E

PI — The number PI

SQRT1_2 — Square root of 1/2

SQRT2 — The square root of 2

Math Methods

abs(x) — Returns the absolute (positive) value of x

acos(x) — The arccosine of x, in radians

asin(x) — Arcsine of x, in radians

atan(x) — The arctangent of x as a numeric value

atan2(y,x) — Arctangent of the quotient of its arguments

ceil(x) — Value of x rounded up to its nearest integer

cos(x) — The cosine of x (x is in radians)

exp(x) — Value of Ex

floor(x) — The value of x rounded down to its nearest integer

log(x) — The natural logarithm (base E) of x
max(x, y, z, ..., n) — Returns the number with the highest value

min(x, y, z, ..., n) — Same for the number with the lowest value

pow(x, y) — X to the power of y

random() — Returns a random number between 0 and 1

round(x) — The value of x rounded to its nearest integer

sin(x) — The sine of x (x is in radians)

sqrt(x) — Square root of x

tan(x) — The tangent of an angle

DEALING WITH DATES IN JAVASCRIPT

Setting Dates

Date() — Creates a new date object with the current date and time

Date(2017, 5, 21, 3, 23, 10, 0) — Create a custom date object. The numbers represent year, month, day, hour, minutes, seconds, milliseconds. You can omit anything you want except for year and month.

Date("2017-06-23") — Date declaration as a string

Pulling Date and Time Values

gDate() — Get the day of the month as a number (1-31)

gDay() — The weekday as a number (0-6)

gFullYear() — Year as a four digit number (yyyy)

gHours() — Get the hour (0-23)

gMilliseconds() — The millisecond (0-999)

gMinutes() — Get the minute (0-59)

gMonth() — Month as a number (0-11)

gSeconds() — Get the second (0-59)

gTime() — Get the milliseconds since January 1, 1970
getUTCDate() — The day (date) of the month in the specified date according to universal time (also available for day, month, fullyear, hours, minutes etc.)

Parse — Parses a string representation of a date, and returns the number of milliseconds since January 1, 1970

Set Part of a Date

setDate() — Set the day as a number (1-31)

setFullYear() — Sets the year (optionally month and day)

setHours() — Set the hour (0-23)

setMilliseconds() — Set milliseconds (0-999)

setMinutes() — Sets the minutes (0-59)

setMonth() — Set the month (0-11)

setSeconds() — Sets the seconds (0-59)

setTime() — Set the time (milliseconds since January 1, 1970)

setUTCDate() — Sets the day of the month for a specified date according to universal time (also available for day, month, fullyear, hours, minutes etc.)

DOM MODE

Node Properties

attributes — Returns a live collection of all attributes registered to an element

baseURI — Provides the absolute base URL of an HTML element

c.childNodes — Gives a collection of an element’s child nodes

firstChild — Returns the first child node of an element

lastChild — The last child node of an element

nextSibling — Gives you the next node at the same node tree level

nodeName — Returns the name of a node
nodeType — Returns the type of a node
nodeValue — Sets or returns the value of a node
ownerDocument — The top-level document object for this node
parentNode — Returns the parent node of an element
previousSibling — Returns the node immediately preceding the current one
textContent — Sets or returns the textual content of a node and its descendants

Node Methods

appendChild() — Adds a new child node to an element as the last child node
cloneNode() — Clones an HTML element
compareDocumentPosition() — Compares the document position of two elements
getFeature() — Returns an object which implements the APIs of a specified feature
hasAttributes() — Returns true if an element has any attributes, otherwise false
hasChildNodes() — Returns true if an element has any child nodes, otherwise false
insertBefore() — Inserts a new child node before a specified, existing child node
isDefaultNamespace() — Returns true if a specified namespaceURI is the default, otherwise false
isEqualNode() — Checks if two elements are equal
isSameNode() — Checks if two elements are the same node
isSupported() — Returns true if a specified feature is supported on the element
lookupNamespaceURI() — Returns the namespaceURI associated with a given node
lookupPrefix() — Returns a DOMString containing the prefix for a given namespaceURI, if present

normalize() — Joins adjacent text nodes and removes empty text nodes in an element

removeChild() — Removes a child node from an element

replaceChild() — Replaces a child node in an element

Element Methods

getAttribute() — Returns the specified attribute value of an element node

getAttributeNS() — Returns string value of the attribute with the specified namespace and name

getAttributeNode() — Gets the specified attribute node

getAttributeNodeNS() — Returns the attribute node for the attribute with the given namespace and name

getElementsByTagName() — Provides a collection of all child elements with the specified tag name

getElementsByTagNameNS() — Returns a live HTMLCollection of elements with a certain tag name belonging to the given namespace

hasAttribute() — Returns true if an element has any attributes, otherwise false

hasAttributeNS() — Provides a true/false value indicating whether the current element in a given namespace has the specified attribute

removeAttribute() — Removes a specified attribute from an element

removeAttributeNS() — Removes the specified attribute from an element within a certain namespace

removeAttributeNode() — Takes away a specified attribute node and returns the removed node

setAttribute() — Sets or changes the specified attribute to a specified value

setAttributeNS() — Adds a new attribute or changes the value of an attribute with the given namespace and name

setAttributeNode() — Sets or changes the specified attribute node
setAttributeNodeNS() — Adds a new namespaced attribute node to an element

WORKING WITH THE USER BROWSER

Window Properties

closed — Checks whether a window has been closed or not and returns true or false

defaultStatus — Sets or returns the default text in the statusbar of a window

document — Returns the document object for the window

frames — Returns all <iframe> elements in the current window

history — Provides the History object for the window

innerHeight — The inner height of a window’s content area

innerWidth — The inner width of the content area

length — Find out the number of <iframe> elements in the window

location — Returns the location object for the window

name — Sets or returns the name of a window

navigator — Returns the Navigator object for the window

opener — Returns a reference to the window that created the window

outerHeight — The outer height of a window, including toolbars/scrollbars

outerWidth — The outer width of a window, including toolbars/scrollbars

pageXOffset — Number of pixels the current document has been scrolled horizontally

pageYOffset — Number of pixels the document has been scrolled vertically

parent — The parent window of the current window

screen — Returns the Screen object for the window
screenLeft – The horizontal coordinate of the window (relative to screen)

screenTop – The vertical coordinate of the window

screenX – Same as screenLeft but needed for some browsers

screenY – Same as screenTop but needed for some browsers

self – Returns the current window

status – Sets or returns the text in the statusbar of a window

top – Returns the topmost browser window

**Window Methods**

alert() – Displays an alert box with a message and an OK button

blur() – Removes focus from the current window

clearInterval() – Clears a timer set with setInterval()

clearTimeout() – Clears a timer set with setTimeout()

close() – Closes the current window

confirm() – Displays a dialogue box with a message and an OK and Cancel button

focus() – Sets focus to the current window

moveBy() – Moves a window relative to its current position

moveTo() – Moves a window to a specified position

open() – Opens a new browser window

print() – Prints the content of the current window

prompt() – Displays a dialogue box that prompts the visitor for input

resizeBy() – Resizes the window by the specified number of pixels

resizeTo() – Resizes the window to a specified width and height

scrollBy() – Scrolls the document by a specified number of pixels

scrollTo() – Scrolls the document to specified coordinates
setInterval() — Calls a function or evaluates an expression at specified intervals

setTimeout() — Calls a function or evaluates an expression after a specified interval

stop() — Stops the window from loading

Screen Properties

availHeight — Returns the height of the screen (excluding the Windows Taskbar)

availWidth — Returns the width of the screen (excluding the Windows Taskbar)

colorDepth — Returns the bit depth of the color palette for displaying images

height — The total height of the screen

pixelDepth — The color resolution of the screen in bits per pixel

width — The total width of the screen

**JAVASCRIPT EVENTS**

Mouse

onclick — The event occurs when the user clicks on an element

oncontextmenu — User right-clicks on an element to open a context menu

ondblclick — The user double-clicks on an element

onmousedown — User presses a mouse button over an element

onmouseenter — The pointer moves onto an element

onmouseleave — Pointer moves out of an element

onmousemove — The pointer is moving while it is over an element

onmouseover — When the pointer is moved onto an element or one of its children
onmouseout — User moves the mouse pointer out of an element or one of its children

onmouseup — The user releases a mouse button while over an element

**Keyboard**

onkeydown — When the user is pressing a key down

onkeypress — The moment the user starts pressing a key

onkeyup — The user releases a key

**Frame**

onabort — The loading of a media is aborted

onbeforeunload — Event occurs before the document is about to be unloaded

onerror — An error occurs while loading an external file

onhashchange — There have been changes to the anchor part of a URL

onload — When an object has loaded

onpageshow — When the user navigates to a webpage

onpagehide — The user navigates away from a webpage

onresize — The document view is resized

onscroll — An element’s scrollbar is being scrolled

onunload — Event occurs when a page has unloaded

**Form**

onblur — When an element loses focus

onchange — The content of a form element changes (for `<input>`, `<select>` and `<textarea>`)  

onfocus — An element gets focus

onfocusin — When an element is about to get focus

onfocusout — The element is about to lose focus
oninput — User input on an element
oninvalid — An element is invalid
onreset — A form is reset
onsearch — The user writes something in a search field (for <input="search">)
onselect — The user selects some text (for <input> and <textarea>)
onsubmit — A form is submitted

Drag
ondrag — An element is dragged
ondragend — The user has finished dragging the element
ondragenter — The dragged element enters a drop target
ondragleave — A dragged element leaves the drop target
ondragover — The dragged element is on top of the drop target
ondragstart — User starts to drag an element
ondrop — Dragged element is dropped on the drop target

Clipboard
oncopy — User copies the content of an element
oncut — The user cuts an element’s content
onpaste — A user pastes content in an element

Media
onabort — Media loading is aborted
oncanplay — The browser can start playing media (e.g. a file has buffered enough)
oncanplaythrough — When browser can play through media without stopping
ondurationchange — The duration of the media changes
onended — The media has reach its end

onerror — Happens when an error occurs while loading an external file

onloadeddata — Media data is loaded

onloadedmetadata — Meta data (like dimensions and duration) are loaded

onloadstart — Browser starts looking for specified media

onpause — Media is paused either by the user or automatically

onplay — The media has been started or is no longer paused

onplaying — Media is playing after having been paused or stopped for buffering

onprogress — Browser is in the process of downloading the media

onratechange — The playing speed of the media changes

onseeked — User is finished moving/skipping to a new position in the media

onseeking — The user starts moving/skipping

onstalled — The browser is trying to load the media but it is not available

onsuspend — Browser is intentionally not loading media

ontimeupdate — The playing position has changed (e.g. because of fast forward)

onvolumechange — Media volume has changed (including mute)

onwaiting — Media paused but expected to resume (for example, buffering)

**Animation**

animationend — A CSS animation is complete

animationiteration — CSS animation is repeated

animationstart — CSS animation has started

**Other**
transitionend — Fired when a CSS transition has completed

onmessage — A message is received through the event source

onoffline — Browser starts to work offline

ononline — The browser starts to work online

onpopstate — When the window’s history changes

onshow — A <menu> element is shown as a context menu

onstorage — A Web Storage area is updated

ontoggle — The user opens or closes the <details> element

onwheel — Mouse wheel rolls up or down over an element

ontouchcancel — Screen touch is interrupted

ontouchend — User finger is removed from a touch screen

ontouchmove — A finger is dragged across the screen

ontouchstart — Finger is placed on touch screen

Errors

try — Lets you define a block of code to test for errors

catch — Set up a block of code to execute in case of an error

throw — Create custom error messages instead of the standard JavaScript errors

finally — Lets you execute code, after try and catch, regardless of the result

Error Name Values

name — Sets or returns the error name

message — Sets or returns an error message in string from

EvalError — An error has occurred in the eval() function

RangeError — A number is “out of range”

ReferenceError — An illegal reference has occurred
SyntaxError — A syntax error has occurred

TypeError — A type error has occurred

URIError — An encodeURI() error has occurred
